

Operating a Safe Workplace

The commitment to health and safety – for Range employees, contractors and the communities where we work – is a pillar of our organization.

Range uses best practices for safety procedures to help maintain an efficient, safe working environment. Dedicated health, safety and environmental employees support our efforts in each divisional office, conducting frequent site inspections and engaging employees in safety and preparedness

Safety Begins With Me

Responsibly developing natural gas starts with creating and operating a safe workplace. Range's policy is that every shift at a location must begin with a safety meeting, which provides employees and contractors with a Job Safety Analysis (JSA) for the day.

At Range, safety is a culture and a personal responsibility of anyone on a Range location. A stop work protocol is applied to all Range locations, giving employees, contractors or visitors the ability to stop ongoing work if imminent danger exists to personnel, property or the environment.

Programs

Range utilizes a combination of computer based training and live safety meetings to continually educate personnel and contractors. We have also worked with first responders to develop customized well site training to best prepare them in case of an emergency.

Range implements Safety Alerts to address industry incidents and so called near misses. These alerts describe an incident and its impact, to help educate personnel and prevent future occurrence.

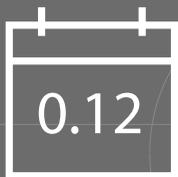

Lagging and Leading Indicators

Range uses both lagging and leading indicators to gauge the company's safety and environmental performance, and identify areas for improvement. By using statistical data and analytics, Range measures performance by using OSHA's criteria for determining rates for injuries and incidents that result in lost time or restricted duty.

Proactively mitigating and eliminating risks on location is critical to keeping our employees, our contractors and the community safe.
